rotated_abcdefghijklmnop

rotated_45degrees_abcdefgh

	███defghijklmnopqrstu		
		vwxyz	

How to test & what to look for
1. rectangle mode
- paint one cell exactly, check redacted PDF
- paint top left, bottom right
- use browser zoom, check rectangles
- resize window, check rectangles
- check console.log, make sure scaleFactor and renderDensityFactor are ≠1.0 (window size affects them)
- paint over text spans, switch to text mode

████████
- check that rectangles touching texts redact them
- select some text, check created rectangle – does it cover nicely
- select multiple spans
- double click on a span to select all of it
- select a substring
- start a selection, end it outside the modal (selection should be canceled)

3. rendered PDF
- open in preview, ctrl-a to select all – are there invisible texts over the bitmaps?

- repeat everything for rotated text spans
- repeat everything for rotated pages
- repeat everything with browser zoom
- do use the pan+zoom tools, repeat

notes
- don't worry about the many empty spans in the top and bottom rows
- a.t.m. non-90° rotated spans are poorly supported
- create PDF: export, then rotate:
pdftk A=redaction-test-rotated.pdf cat A Aeast Asouth Awest output out.pdfs

mnopqrstuvxyz01234

How to test & what to look for

1. rectangle mode
- paint one cell exactly, check redacted PDF
- paint top left, bottom right
- use browser zoom, check rectangles
- resize window, check rectangles
- check console.log, make sure scaleFactor and renderDensityFactor are $\neq 1.0$ (window size affects them)
- paint over text spans, switch to text mode

2. text mode
- check that rectangles touching texts redact them
- select some text, check created rectangle — does it cover nicely
- select a substring
- double click on a span to select all of it
- select multiple spans
- start a selection, end it outside the modal (selection should be canceled)

3. rendered PDF
- open in preview, ctrl-a to select all – are there invisible texts over the bitmaps?
